Open cavities discovered between the inner and outer skins of brick or block work should be closed in accordance with the local building authority regulations.

Windows should be installed in the opening without twisting, racking or distorting.
1. Frame Fixing

Measure the opening, checking it fits with all measurements on your Origin paperwork.

1.1. Place the correct frame shims along the bottom of the opening to create a level, well supported platform for the window to sit. (Fig.1). Each shim should be placed in line with the pre-drilled fixing hole in the window frame.
1. Frame Fixing (continued)

1.2. Place the window on the pre prepared frame shims and re-check for level. Adjust if necessary. Once complete, remove window from the opening once more. (Fig.2)

1.3. Run a bead of sealant across and in between shims for window to sit in.
1.4. Place the window in the opening and secure all four sides of the frame as follows:

- Frame anchors to be installed at pre-drilled locations (please refer to the back of this guide for installation anchorage details for different substrates etc).

1.4.1. Insert suitable frame shims at the top and sides of the frame in line with each pre-drilled set of anchor holes. Care should be taken not to twist or bow the frame as the anchor is tightened.

1.4.2. Install one pair of frame anchors in the bottom of the frame close to the centre.

1.4.3. Making sure the frame is sitting plumb in the opening install the opposite pair of anchors in the top of the frame.

1.4.4. Repeat this process until all frame anchors have been installed into all four sides of the frame. It is wise to check the frame for level and square after each pair of anchors has been installed.

1.4.5. Once all anchors are in place, work the sealant around each of the anchor heads to prevent water from leaking into the frame.
2. Glazing

- **2.1.** All insulated glass units should be examined for damages and defects before installation.

- **2.2.** Close the window and fully engage the lock.

- **2.3.** Remove the 4 glazing beads.

- **2.4.** Place glazing shims in the bottom of the glazing chamber spaced approximately 2” in from each corner and no more than 18” centres. (Fig.4)

- **2.5.** Install the glass on the shims.

- **2.6.** Place the required shims between the glass and frame on the remaining 3 sides, spaced as in step 2.4. being careful not to bow or twist the sash.

- **2.7.** Apply a small amount of sealant to the bottom of each shim on the vertical sides to stop the shim from slipping down over time.
2.8. Re-install the four glazing beads. For safety, always ensure the top bead is installed first, followed by the bottom and then the side beads. (Fig. 5) For fixed/picture windows, apply sealant inside the channel from where the bead was removed prior to re-installing the bead.

2.9. Insert the glazing wedge gasket between the glass unit and the glazing bead and cut to length.

3.0. For fixed/picture windows, apply sealant along each mitered corner where glazing beads meet.
3. Finishing

3.1. Wherever practical, the perimeter of the window should be foam filled between the window and the substrate.

3.2. Sealant must be applied around the outside perimeter of the window frame and opening /mull bar (if used). (Fig.6)
